SQL Part 3

Database Systems & Information Modelling
INFO90002.

Week 5 - SQL

Dr Tanya Linden
Dr Renata Borovica-Gajic
David Eccles

This Lecture Objectives

Extending your knowledge

Query Nesting, Comparison Operators, EXISTS, NOT EXISTS, VIEWS

- DML
 - Query nesting
 - Subquery
 - Views
- DCL
 - Data Control Language

How to think about SQL

- Problem Solving

Query Nesting

Complex queries

Query Nesting

SQL provides the ability to *nest* subqueries

A nested query is simply another select query you write to produce a table set

- Remember that all select queries return a table set of data

A common use of subqueries is to perform set tests

- Set membership, set comparisons

Sub-Query Comparison Operators

IN / NOT IN

- Used to test whether the attribute is IN/NOT IN the subquery list

ANY

- True if any value returned meets the condition

ALL

- True if all values returned meet the condition

EXISTS

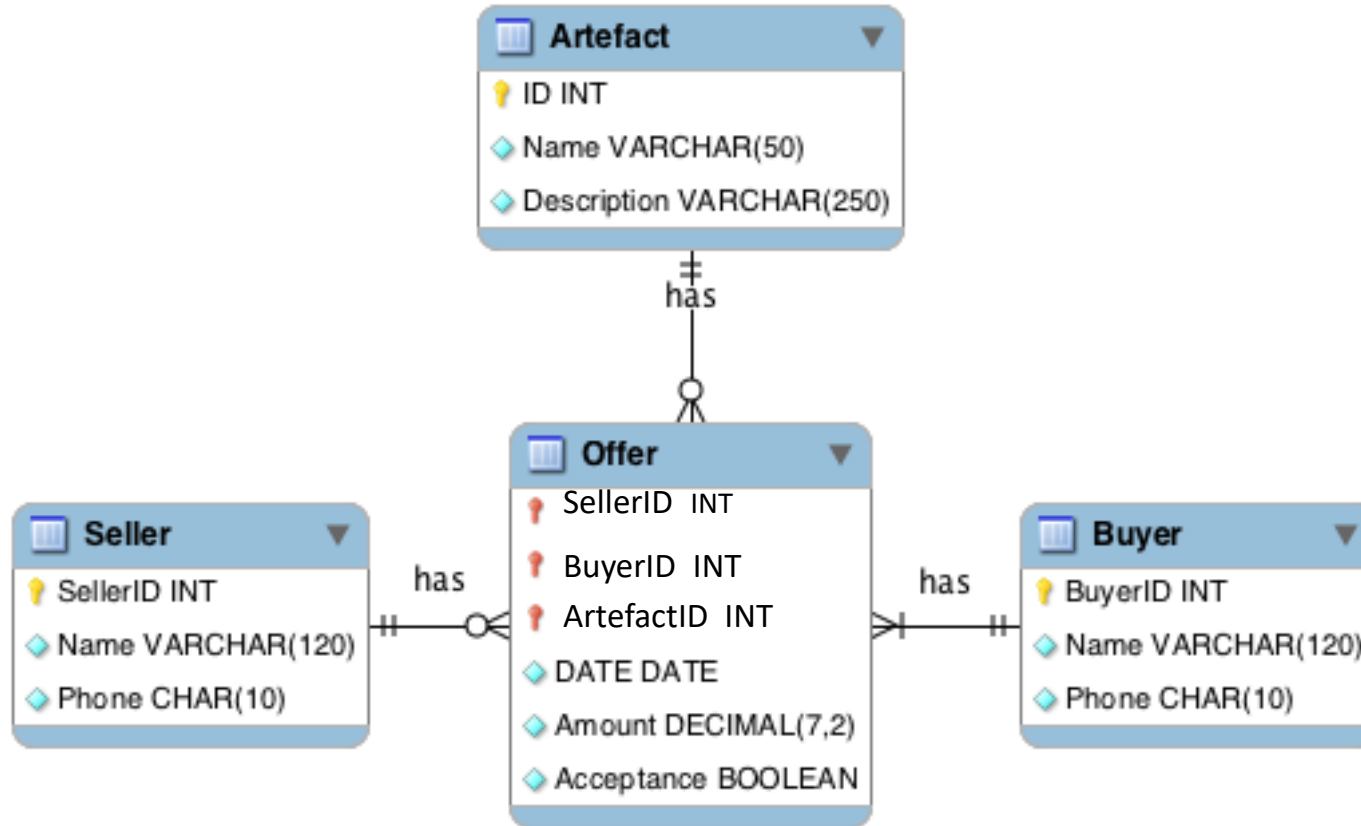

- True if the subquery returns one or more records

- https://www.w3schools.com/sql/sql_exists.asp

General help with SQL: <https://www.w3schools.com/sql/> (great tutorial)

Auction Bids – Physical Model

Tables

Seller

	SellerID	Name	Phone
►	1	Ann	0509 123 321
	2	Bill	0518 234 432
	3	Carol	02 8344 4777

Buyer

	BuyerID	Name	Phone
►	1	Maggie	0539 335 577
	2	Nigel	0519 434 389
	3	Olga	13 24 35

Artefact

	ID	Name	Description
►	1	Vase	Ming Vase H50cm W30cm
	2	Sketch	Early Modern Dutch School
	3	Pot	CopperUS 18th Century

Offer

	SellerID	BuyerID	ArtefactID	OfferDate	Ammount	Acceptance
►	1	1	1	2012-06-20	81223.23	0
	1	1	2	2012-06-20	82223.23	0
	2	2	1	2012-06-20	1995.50	0
	2	2	2	2012-06-20	2300.15	0

Example: Subquery

List the BuyerID, Name and Phone number for all bidders on artefact 1

```
1 • SELECT *
2 FROM Buyer
3 WHERE buyerID IN
4   (SELECT BuyerID
5    FROM Offer
6    WHERE artefactid = 1);
```

	BuyerID	Name	Phone
►	1	Maggie	0539 335 577
	2	Nigel	0519 434 389

More examples using subqueries

Which Artefacts don't have any offers made on them

```
SELECT *  
FROM artefact  
WHERE ID NOT IN  
      (SELECT artefactid  
       FROM offer);
```

ID	Name	Description
3	Pot	CopperUS 18th Century

Exercise

Which Buyers haven't made a bid for the "Pot" Artefact ?

```
select *  
from Buyer  
where buyerID not in  
  (select buyerID  
   from offer  
   where artefactID in
```

Exercise – Solution

*(select ID
from artefact
where name = 'Pot'));*

- Which buyer haven't made a bid for the "Pot" Artefact ?

```
SELECT *  
FROM buyer  
WHERE buyerID NOT IN  
  (SELECT BuyerID  
   FROM offer  
   WHERE artefactID IN  
     (SELECT ID  
      FROM artefact  
      WHERE name = 'Pot'));
```

1	Maggie	0539 335 577
2	Nigel	0519 434 389
3	Olga	13 24 35

This or That? Writing better queries

- Do we need to use IN? Is there another way...
- List the BuyerID, Name and Phone number for all bidders on artefact 1

```
SELECT *  
FROM Buyer  
WHERE BuyerID IN  
  (SELECT BuyerID  
   FROM Offer  
   WHERE ArtefactID = 1)
```

Is equal to:

```
SELECT *  
FROM Buyer  
NATURAL JOIN Offer  
WHERE ArtefactID = 1
```

This is a more efficient way

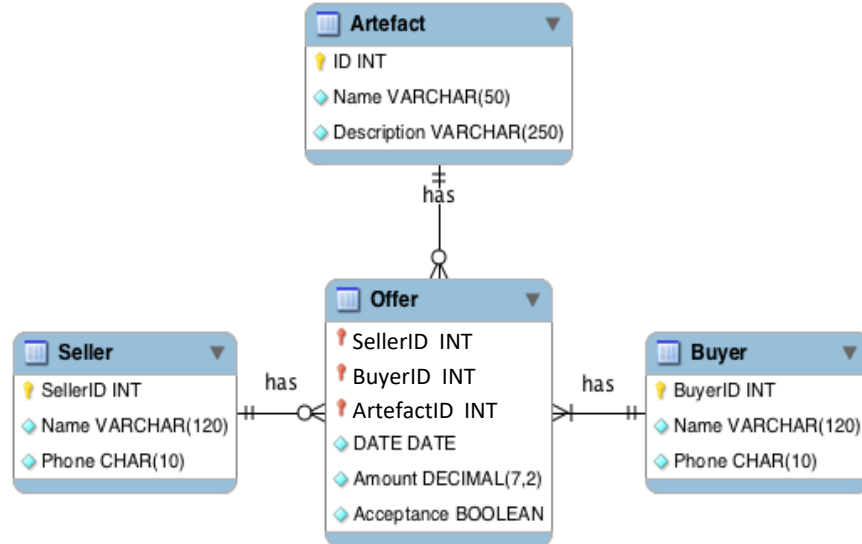

EXISTS - example

Returns true if the subquery returns one or more records

Example: List the BuyerID, Name and Phone number for all bidders on artefact 1

```
SELECT * FROM Buyer
WHERE EXISTS
  (SELECT * FROM Offer
   WHERE Buyer.BuyerID = Offer.BuyerID
   AND ArtefactID = 1)
```

BuyerID	Name	Phone
1	Maggie	0333333333
2	Nicole	0444444444

Views

SQL DDL and DML

Views

Any relation that is not in the physical models, but is made available to the “user” as a virtual relation is called a view.

Views are good because:

- They help hide the query complexity from users
- They help hide data from users (e.g. data users are not authorised to see)
 - Different users use different views
Prevents customers from seeing quantities in stock or original purchase price of an item, for instance
 - One way of improving database security

Syntax:

```
CREATE VIEW nameofview AS validsqlstatement
```

Once a view is defined,

- its definition is stored in the database (not the data, but metadata – schema information)
- it can be used just like any other table
- Every time shows up-to-date data

Create View Example

```
CREATE VIEW EmpPay AS
SELECT Employee.ID, Employee.Name, DateHired,
       EmployeeType, HourlyRate AS Pay
FROM Employee INNER JOIN Hourly
ON Employee.ID = Hourly.ID

UNION
SELECT Employee.ID, Employee.Name, DateHired,
       EmployeeType, AnnualSalary AS Pay
FROM Employee INNER JOIN Salaried
ON Employee.ID = Salaried.ID

UNION
SELECT Employee.ID, Employee.Name, DateHired,
       EmployeeType, BillingRate AS Pay
FROM Employee INNER JOIN Consultant
ON Employee.ID = Consultant.ID;
```

CREATE VIEW example

```
CREATE VIEW v_DEPT_SALARY AS
SELECT department.departmentid, department.name, sum(employee.salary)
AS DEPTSAL
FROM department
INNER JOIN employee
ON department.departmentid = employee.departmentid
GROUP BY department.departmentid, department.name;
```

Using a View

SELECT * FROM EmpPay;

ID	Name	DateHired	EmployeeType	Pay
3	Alice	2012-12-02	H	23.43
4	Alan	2010-01-22	H	29.43
1	Sean	2012-02-02	S	92000.00
2	Linda	2011-06-12	S	92300.00
5	Peter	2010-09-07	C	210.00
6	Rich	2012-05-19	C	420.00

**SELECT * FROM EmpPay
WHERE EmployeeType = "H" OR EmployeeType = "C"**

ID	Name	DateHired	EmployeeType	Pay
3	Alice	2012-12-02	H	23.43
4	Alan	2010-01-22	H	29.43
5	Peter	2010-09-07	C	210.00
6	Rich	2012-05-19	C	420.00

Output Snippets Query 1 Result Lecture7.sql Result x

Fetch 4 records. Duration: 0.000 sec, fetch

Data Control Language

SQL DCL

Data Control Language / Other Commands *beyonds the subject*

DCL

- Users and permissions
CREATE USER, DROP USER
GRANT, REVOKE
SET PASSWORD

Other Commands

- Database administration
BACKUP TABLE, RESTORE TABLE
ANALYZE TABLE
- Miscellaneous
DESCRIBE tablename
USE db_name

They are typically called 'Database Administration Statements'

How to think like SQL...

SQL DDL and DML

How to Think like SQL

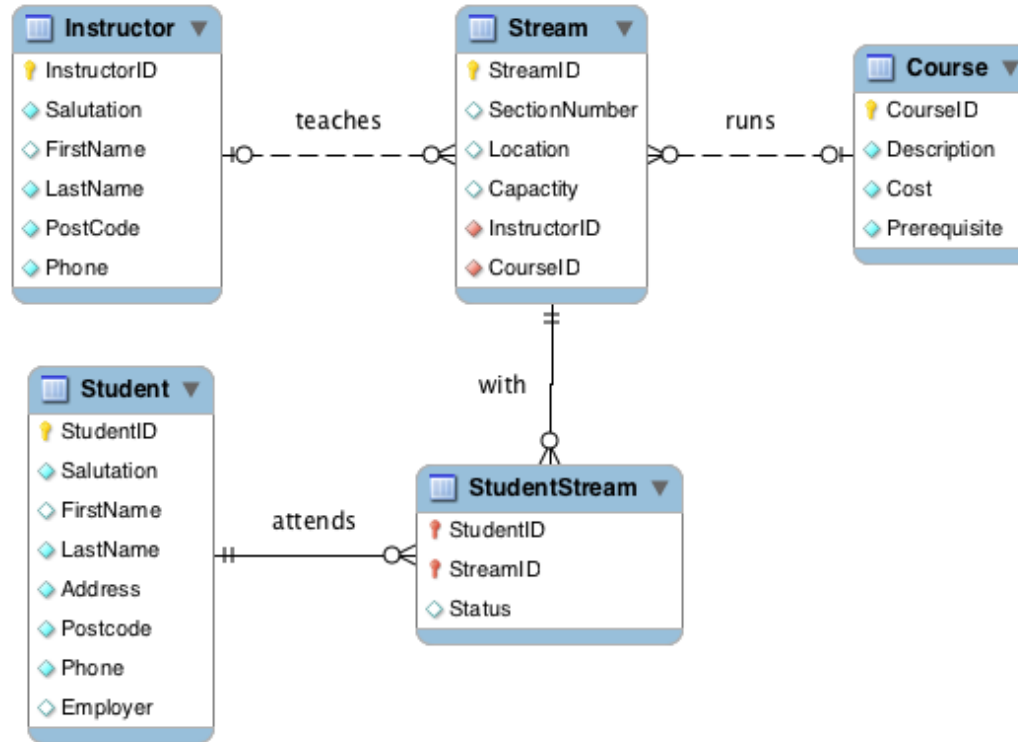

It's going to be critical for you to think like SQL to handle the queries you will need to write...

Hopefully the following discussion will help you in this endeavour:

1. **USE** the database design as a **MAP** to help you when you are formulating queries
2. **USE** the structure of the **SELECT** statement as a template
3. **FILL** out parts of the **SELECT** structure and **BUILD** the query

Let's try it!

Example

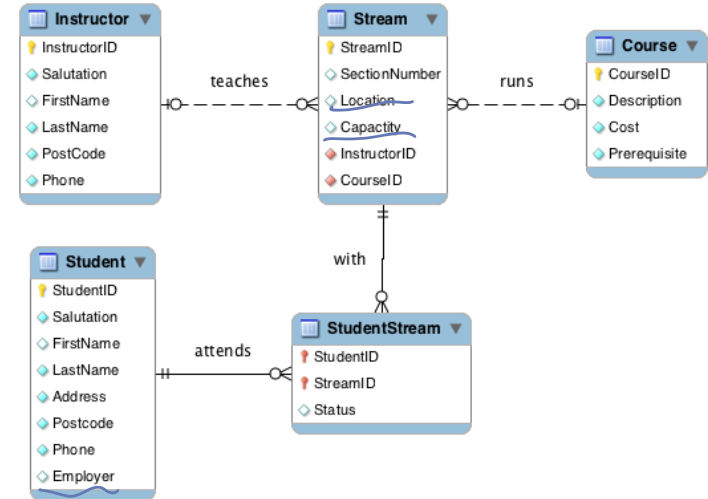

Example: Which employers employ students who are doing a course in locations where the capacity is greater than 20 persons, and what are those locations?

How to approach writing queries

Which employers employ students who are doing a course in locations where the capacity is greater than 20 persons, and what are those locations?

What is the query asking for:

- Which fields & tables:
F: Employer, Location, Capacity
T: Student, Stream, StudentStream
- But only if the capacity > 20 (condition)

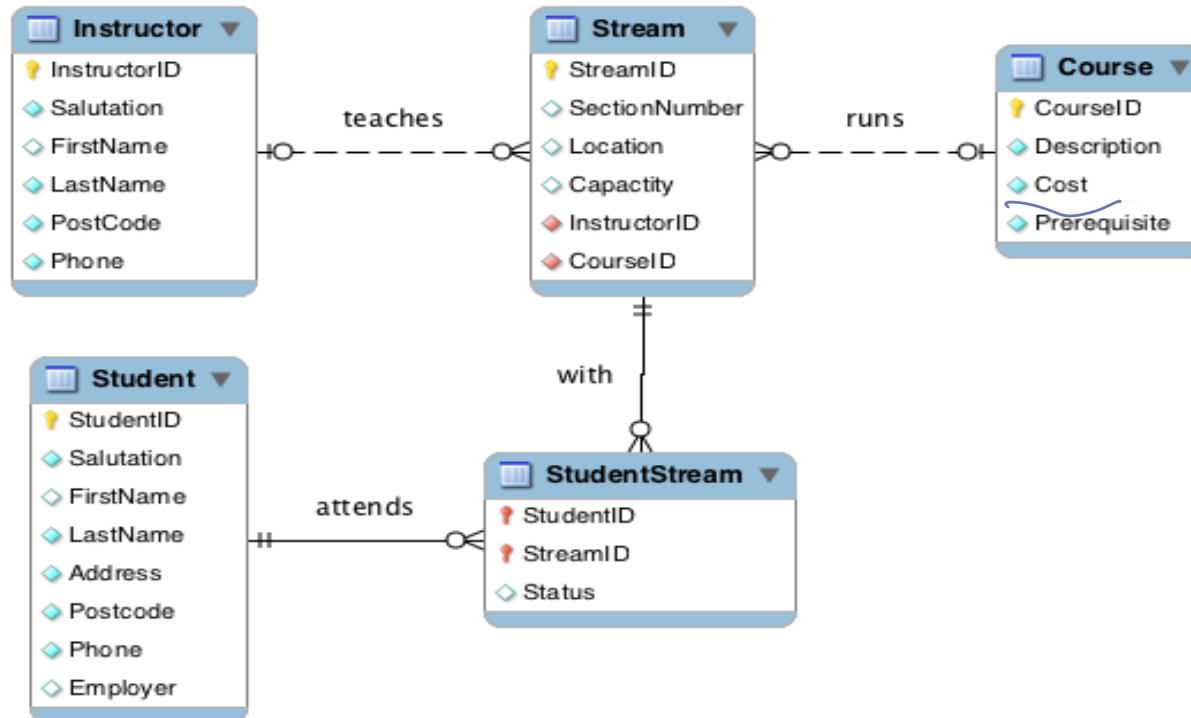

Lets try to use the structure of the SELECT statement now:

SELECT Employer, Location, Capacity *logic correct*
FROM Student
NATURAL JOIN StudentStream *but don't use this*
NATURAL JOIN Stream
WHERE Capacity > 20;

SELECT Employer, Location, Capacity
FROM Student
INNER JOIN StudentStream
ON Student.StudentID = StudentStream.StudentID
INNER JOIN Stream
ON StudentStream.StreamID = Stream.StreamID
WHERE Capacity > 20;

Exercise (your turn)

What is the phone number of the instructor who teaches a course that costs over \$10000 attended by studentID 202.

SQL Video

A very good overview of SQL:

<https://www.youtube.com/watch?v=uRdIdd-UkTc&index=7&list=PLdQddgMBv5zHcEN9RrhADq3CBColhY2hl>

(It runs for 90+ minutes so for viewing in your own time)

LeetCode

trouble

shooting

What's examinable

- **You need to know how to write SQL**
 - **DML**
 - **DDL**

THE UNIVERSITY OF
MELBOURNE

Thank you
